# **mpiea\_mmr Documentation**

***Release 0.1.2***

**Andres FR**

**Mar 25, 2019**

**CONTENTS:**

<b>1</b>	<b>mpiea_mmr package</b>	<b>1</b>
1.1	Submodules . . . . .	1
1.2	mpiea_mmr.blender_utils module . . . . .	1
1.3	mpiea_mmr.foo_module module . . . . .	2
1.4	Module contents . . . . .	2
<b>2</b>	<b>Indices and tables</b>	<b>3</b>
	<b>Python Module Index</b>	<b>4</b>
	<b>Index</b>	<b>5</b>

## MPIEA\_MMR PACKAGE

### 1.1 Submodules

### 1.2 `mpiea_mmr.blender_utils` module

Utilities for interaction with Blender

```
class mpiea_mmr.blender_utils.ArgumentParserForBlender (prog=None, usage=None,  
description=None, epilog=None, parents=[],  
formatter_class=<class 'argparse.HelpFormatter'>,  
prefix_chars='-', from_file_prefix_chars=None,  
argument_default=None, conflict_handler='error',  
add_help=True, allow_abbrev=True)
```

Bases: `argparse.ArgumentParser`

This class is identical to its superclass, except for the `parse_args` method (see docstring). It resolves the ambiguity generated when calling Blender from the CLI with a python script, and both Blender and the script have arguments. E.g., the following call will make Blender crash because it will try to process the script's `-a` and `-b` flags:

```
blender --python my_script.py -a 1 -b 2
```

To bypass this issue this class uses the fact that Blender will ignore all arguments given after a double-dash (`--`). The approach is that all arguments before `--` go to Blender, arguments after go to the script. The following CLI calls work fine:

```
blender --python my_script.py -- -a 1 -b 2  
blender --python my_script.py --
```

**`get_argv_after_doubledash`** (*argv*)

**Parameters** *argv* (*list of str*) – Expected to be `sys.argv` (or alike).

**Returns** The `argv` sublist after the first `--` element (if present, otherwise returns an empty list).

**Return type** list of str

---

**Note:** Works with any *ordered* collection of strings (e.g. list, tuple).

---

#### **parse\_args()**

This method is expected to behave identically as in the superclass, except that the `sys.argv` list will be pre-processed using `get_argv_after_doubledash` before. See the docstring of the class for usage examples and details.

---

**Note:** By default, `argparse.ArgumentParser` will call `sys.exit()` when encountering an error. Blender will react to that shutting down, making it look like a crash. Make sure the arguments are correct!

---

## 1.3 mpiea\_mmr.foo\_module module

Module containing a simple class with low memory and runtime requirements.

**class** `mpiea_mmr.foo_module.Foo` (*size=1000000*)

Bases: `object`

A simple class with low memory and runtime requirements.

#### **get\_result()**

Basic getter.

#### **loop** (*times*)

Restart result and run computation a number of times.

## 1.4 Module contents

Init file for the add-on.

To install it, make sure Blender's Python is able to find it under `addon_utils.paths()`, and that the Blender version matches to make it installable.

Alternatively, run this init file as a script from Blender.

`mpiea_mmr.register()`

`mpiea_mmr.unregister()`

## INDICES AND TABLES

- `genindex`
- `modindex`
- `search`

## PYTHON MODULE INDEX

### m

`mpiea_mmr`, [2](#)  
`mpiea_mmr.blender_utils`, [1](#)  
`mpiea_mmr.foo_module`, [2](#)

## INDEX

### A

`ArgumentParserForBlender` (class in `mpiea_mmr.blender_utils`), 1

### F

`Foo` (class in `mpiea_mmr.foo_module`), 2

### G

`get_argv_after_doubledash()`  
(`mpiea_mmr.blender_utils.ArgumentParserForBlender`  
method), 1

`get_result()` (`mpiea_mmr.foo_module.Foo` method),  
2

### L

`loop()` (`mpiea_mmr.foo_module.Foo` method), 2

### M

`mpiea_mmr` (module), 2

`mpiea_mmr.blender_utils` (module), 1

`mpiea_mmr.foo_module` (module), 2

### P

`parse_args()` (`mpiea_mmr.blender_utils.ArgumentParserForBlender`  
method), 2

### R

`register()` (in module `mpiea_mmr`), 2

### U

`unregister()` (in module `mpiea_mmr`), 2
